### Abstract

Virus fighting is going to become a common and convenient means for human to will be survived. More-and-more Viruses are kept on arriving over the world, forcing human to increase the set of knowledge and using intelligent data to predict and decide more accurately and correctly. The availability of different new viruses increase the complexity of discovery as well as the selection process to overcome them. In this research we are sharing our results from data science to fight against the new generation of viruses. Our data consist of human prediction by iridology, human genes, the data obtained in last few months about the new generation of viruses. At the end we try to offer the ways which human can fight with these viruses. By decreasing the probability of virus fusion In the body and some other useful ways.

## Introduction

When the body starts fighting with viruses, if the body is not able to win, the immune system makes a substance called (Tumor Necrosis Factor) TNF. At the same time white blood cells produce Immunoglobulin. At the first they produce IgM. By the CSR process IgM will be changed to IgG which its duty is to go and attach to antigens such as viruses and by its transparent destroy viruses. By producing more Immunoglobulin the prothrombins convert to thrombins. More and more thrombins make the blood clot. More blood clot makes the hearth to bit more and more hearth bit produce BNP enzyme and more BNP makes lung problems, lung problems, make hearth bit more and more BNP, more lung problem again and again. More hearth bit makes less oxygen and more blood sugar, more blood sugar makes the blood clot more, again more hearth bit shown in figure 1. At the first attack of new generation of viruses (NGV) most of people died because of blood clot. The blood clot can make death by heart attack, brain attack, lung problems, and etc. in this condition any TNF inhibitor like Dexamethasone, which decreases the power of the immune system, helps the body to produce less thrombin so blood clot will be decreased. The number of death due to blood clot decreases by this solution. On the other hand by decreasing the power of immune system, we let other viruses be more active in the body. From this point, our story will be started. Because NGV in the body makes fusion. The NGV fusion to other kind of viruses which were no danger to human, makes it dangerous. When NGV combine with traditional viruses (TV) the new generation of viruses from traditional kind of viruses will be appeared in the world NTV. As you know in the world the L type of corona virus exist for long time in the world. When the S type of corona virus starts to kill human since 2019 the L type dose not kill anybody. Later on after fusion the L type started to kill human more dangerous than the S type. Doctors said there is two types of it. But actually human should be ready for more than 1000 types of NGVs. So, it is better we do not call them with the same name but different in addition, the role of medicinal plants has become more prominent in the society because plants are more available and agree with nature. They are also far from the harms of using chemical drugs, Olive is one of the herbal remedies that has long been available in the form of treatment and in people's food basket. Consumption of olive fruit has long been of special importance among communities, especially in the Mediterranean region. Also, the oil of this fruit has far more benefits than animal oil. Another widely used part of this plant that has received less attention is the olive leaf. Olive leaf, like its fruit, has many uses and benefits. From ancient times, olive leaves have been used to treat many diseases. Olive leaf smoke has also been used to disinfect places. In fact modern laboratory studies indicate the antibacterial, anti-inflammatory and antioxidant properties of olive leaf. Olive leaf is responsible for a wide range of therapies. Olive leaf can fight viruses because of its properties, so it is very suitable for viral diseases. One of its types is herpes. Olive leaves are also very useful in treating obesity, controlling blood pressure, diabetes and cancer. There are subclasses of viruses in the world, including smallpox, chicken pox, influenza, Ebola, mumps, AIDS, SARS, viral plant diseases, herpes simplex diseases, animal viral diseases, dengue fever, yellow fever, tuberculosis, influenza, Redness, viral infections of the respiratory tract, viral infections of the central nervous system, types of hepatitis, genital herpes. Kind, because any virus fusion in the body makes new kind of NTVs. In this study we are going to introduce some of ways to predict virus fusion. Predict the human on more risk and the solutions.

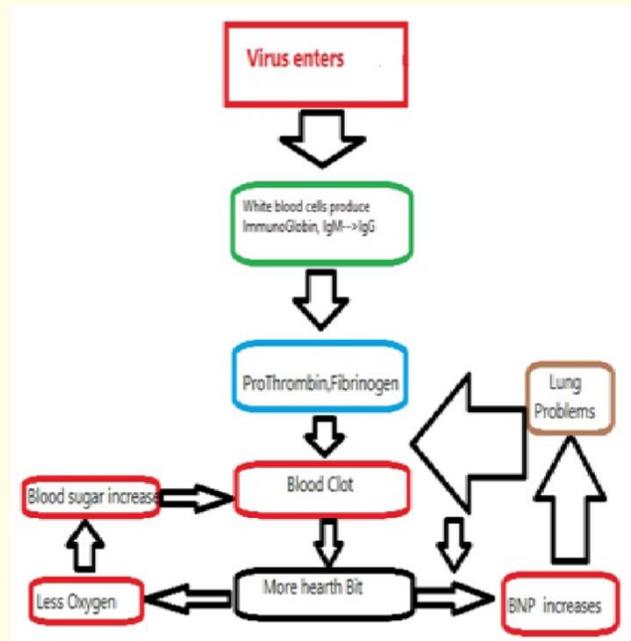

Figure 1

### Related works

There is a lot of valuable works in this area. This is the time to not to compete but help each other to find the best solutions.

### Discussion

First step of fighting against New Generation of Viruses (NGV) is to decrease the blood clot, due to increase of immunoglobulin produced by white blood cells which force the prothrombins (prothrombin is electro-negative in blood and directly proportional to blood clot) convert to thrombins (as thrombins increase, blood clot increase). This problem can be solved by reduction of power of the immune system (for example using Dexamethasone), such that less immunoglobulin produce in the body. Less immunoglobulin, less IgM, less IgG, less conversion of prothrombin to thrombin, less thrombin, less blood clot. Less blood clot will help the number of 22

Death become less. Second step starts when human's power of the immune system decreases, at this point other viruses can easily activate in the body because of shortage of fight against them. Now we have NGV and traditional viruses at the same place. By fusion between this two we can see newborn of traditional viruses, but very dangerous than previous ones NTV. As an example, L type of corona virus. What can we do to stop fusion of viruses in our bodies? The speed of fusion can be increased by electrostatic. We can decrease the electrostatic in our body by discharging it. As a matter of fact if even one person do not take care of himself/herself he/ she will help to generate new kinds of dangerous viruses in their body and transfer it to other people. These NTVs try to change our DNA. By decreasing the toxins in the body, we can prevent them for doing their duties. Mercury, lead, arsenic, heated plastic, Teflon, flu vaccine (because of having mercury) tooth paste any not organic man-made has Toxin. Toxins location is fat cells, so fatness also is dangerous. The blood type O has two kind of antibodies which make the immune system more powerful plus that the factor of Alfa2M makes the blood type O not to be clot easily. The blood type O is the first blood type of human beginning. Later on the human's blood type of A, B, AB consequently appeared in the world. As you know the blood type AB does not have any antibody plus that their blood going to be clot (same as blood type B) faster than other blood types. So as time passes the human's living kind

changed to unnatural their blood changed to worse. As the newer blood types appear the human immune system power decreases and their blood become faster clot, it means they catch more diseases, they are angrier, they are dyeing more from heart attack, and etc. because of their blood type become clot faster. This shows us living in nature and eating natural foods and etc. is better not only by this reason but also because living naturally makes less Toxins. Other useful factors are discharging the body from electrostatic such that prevent the fusion inside our body. Since the earth is under magnetic attack now a days discharging the body 7 times or more per day is required. Even if one person do not take care of himself/ herself by living naturally eating natural foods discharging and etc. make his/her body good target to make the NTV inside it and transfer it to others and kill others without knowing what he/she dose. We are at the very early of long war against NTVs. Blood clot is directly proportional to the following factors: vitamin K because of hypoprothrombinemia which act same as prothrombin in the body, fibrinogen, platelet, factor 8, factor 7, factor 2, not digested calcium, lipids, electro-negative, protein diet, tropin C, tropin T, tropin I. Blood clot is indirectly proportional to factors such as vitamin. In addition

E (because of anti-heparinic, antioxidant), chymotrypsin, and vitamin D (because of digesting the undigested calcium), manganese (because of digesting the undigested calcium), electro-positive, alfa2M (exist in the blood type O), vegetable diet, sun shine (because of digesting the undigested calcium). The ways we can prohibit blood clot are: drinking more water, taking more kiwi, garlic, olive oil, nuts (more vitamin E), honey, green vegetables, carrot and fruits. Not to take beef, scraped, brain, caviar, full fat cheese, chicken, kidney, liver, lungs, tongue, bone marrow, butter, chicken fat, goose fat, peanut butter, brazil nuts, dry beans, green beans, dry peas, green peas [1-6]. In addition Human have been fighting viruses for thousands of years. The new virus is no exception to this rule. In recent decades, several viruses have been transmitted from animals to humans and have claimed thousands of lives, including the Ebola virus, which originated in 2-5 in West Africa. An outbreak has killed 9.8% of infected people, making the virus the deadliest member of the Ebola family. There are other viruses as much or even more deadly, including the coronavirus, which currently infects and kills a number but still has a lower rate than other dangerous viruses. But due to the lack of confrontation, it is still a serious threat. Olive is a tree that is found in most climates and is easily accessible to the general public. It is very easy, convenient and cheap. Also, according to the uses of olive leaves that we have mentioned and its inclusion and generality of its properties and its uses, simplicity, convenience, cheapness and availability, the use of olive leaves is more justified. One of the big problems with chemical drugs is their side effects, and that chemical drugs often have no healing power and are only used to control the disease. The use of olive leaves also prevents the waste of financial resources of governments and individuals and by creating a high level of health in communities. Olive leaf is a very strong antibacterial and antiviral. It strengthens the immune system. It warms the brain. Prevents infections. Eliminates toxins (or soda) It eliminates infections and It is an antioxidant. Olive leaves are even more effective than olive oil. Olive leaf smoke can be used to disinfect and clean indoor environments. "Anti-cancer effect of olive leaf extract" In studies on the lives of people in the Mediterranean, scientists have found a longer life expectancy and a lower incidence of cardiovascular disease and cancer in the people of this region. The polyphenols in olive oil play an important protective role in the body's health and fight against cancer. But here it is necessary to say that the amount of polyphenols in olive oil is very low. In contrast, the amount of polyphenols in olive leaf extract contains a high amount and variety of polyphenols. There are also many structural differences between olive oil versus olive leaves. The polyphenols in olive leaves play an important role in the fight against cancer and inflammatory diseases, and protect DNA damage caused by free radicals, thus preventing negative genetic changes and breaking the chain of many genetic diseases. In this case, the use of olive leaf extract has an effect on treatment and prevention methods. The European Food Safety Authority has emphasized that olive leaf polyphenols help protect blood lipids from oxidative stress. Due to the cultivation of olives in areas with more sun, olive trees synthesize high amounts of polyphenols stored in their thick leaves. The concentration and variety of polyphenols will be affected by many factors such as geographical location, tree cultivar and Tree age. Polyphenols include different phenolic groups, each of which consists of an aromatic ring with a number of hydroxyl groups. Polyphenols are often transported conjugated with one or more hydroxyl sugars. The main phenolic compounds are iodide sequoids and flavonoids that have been shown to be effective in inflammatory and metabolic biomarkers in humans and animals. Also, the effects of olive leaf include its effect on type 2 diabetes, high blood

pressure, obesity, boosting the immune system and being rich in antioxidants. Remdesivir (GS-5734) is a drug that is prescribed for patients with new virus and has good results. Formula; GS-5734. After entering the cell, the drug converts to GS-704277 and then GS-704277 converts to nucleoside monophosphate and then to nucleoside triphosphate. It works inside the cell as the inhibitors of RdRp and prevents the proliferation of new virus inside the cell. Instead, olive leaves can be used because this substance is known in olive leaves as antiviral. Olive leaf has other effective substances such as vitamin D. What xanthine oxidizes causes oxidation of hypoxanthine to xanthine, xanthine is converted to uric acid, and uric acid is converted to superoxide radicals and hydrogen peroxide (during oxidation) and it causes many diseases, including cancer. But olive leaf has anti carcinogenic properties that purify the metabolic enzyme and its effect on the body. As you know, to treat the President of the United States, to use vitamin D and Remdesivir drug, which is the nucleoside of phosphide. In fact, these two substances are effective in healing them naturally in olive leaves. Olive leaves contain Oleuropein, Liks trosayd, Oleuropein agrikon, Course setting, Isorhamnetin and etc. These substances are effective as anti-carcinogenic as well as anti-oxidant, anti-microbial and anti-inflammatory. Another substance found in olive leaves that is high in hydroxytyrosol, which helps prevent breast cancer. Olive leaves have been used as a remedies for many years. [14] As explained above, the main factor preventing the virus from replicating in the body is the more nucleoside phosphide and the combination of D-c, which can be used both chemically and in the immediate and natural form of olive leaf cigarette smoke. Vitamin D not only eliminates unabsorbed calcium in the body, but also prevents viral diseases such as colds, flu, allergies, bronchitis, etc. This is because the presence of vitamin D in the lungs kills viruses and germs that enter the body through respiration. Research has shown that the lungs prevent viruses and germs from entering the body by producing vitamin D. Therefore, vitamin D boosts the body's immune system. [13]. At this point we are going to give a newer results of our researches. At the point of blood clot at the beginning of the virus fighting in the body we can use Olive Leaf Extractor to stop blood clotting. To prevent the virus to settle down in the lung we can use Olive Leaf Cigarettes, to power the lung to kick the virus out of the lung. In the case the virus enter the body the Olive Leaf Extractor prevent the viruses to create more viruses in the cells by the existence of nucleoside triphosphate and vitamin D in the Olive Leaf Extractor.

## Conclusion

In this research, the main aim is to develop a new method to predict NTVs to be created and try to stop blood clot not by decreasing immune system and to develop a new method to overcome new virus attack very cheap available everywhere and more healthy, just by nutrition. To prevent viruses enter the lung at the beginning we use the cigarettes of Olive Leaf then later on if the viruses enter the body due to body defenses against the viruses by antibodies and the blood clot take place we use leech therapy to increase the body immune system and decrease the blood clot at the same time we use Olive Leaf tea to increase body immune system more than before, decrease the blood clot, prevent the fusion of viruses in the cells and do not let the viruses transfer among the cells.
